Nested namespaces

- What is meant by a "nested namespace"?
  - A namespace which is defined inside another namespace is said to be "nested"
- Write a simple program which defines a nested namespace
- Inside the nested namespace, define a symbol
- Access this symbol from main()

Inline namespaces

- What is meant by an "inline namespace"?
  - An inline namespace is similar to a nested namespace
  - However, symbols defined in the inline namespace can be accessed as though they were defined in the outer namespace
- Write the same program as in the last exercise, but this time using an inline namespace instead of a nested namespace
